

RÉGENS LOGISTICS® - DOMESTIC FREIGHT DISTRIBUTION

DESCRIPTION

The distribution module of Régens logistics systems enables continuous monitoring of customer orders from different channels to allow efficient and accurate work of logistics personnel.

Customers can be easily kept informed of the status of their orders.

The distribution module supports mass management of distribution tasks on a clear, easy-to-use organizer interface. The tasks can be monitored during the whole process - from fixing to billing.

The module supports group operations such as importing data, pricing, status management, feedback, and billing.

Our web-based portal solution, which is linked to the module, enables the supply chain operators to work together and get real-time information.

With the web-based portal, we offer a platform for managing and following the tasks of domestic and international supply chain operators.

Consignments are provided with a unique identifier, allowing logistics service providers to work accurately, efficiently and quickly with online barcode readers.
